Iris.ai

Iris.ai – Your (delocalized) Science Assistant

Iris.ai is a Norway based AI startup founded a bit over 3 years ago at Singularity University with the broad goal to make science easily accessible and open to everyone. As the world has more scientific knowledge than ever, and it has become virtually impossible to keep up with and navigate it manually, we are building AI powered science assistant tools that help researchers with efficiently finding relevant research for their research problems. Teams using our current tools are consistently outperforming their peers relying on conventional search tools, and have successfully reduced their required time for systematic research field mapping studies from several weeks to a few days, while upholding or even increasing precision. The ultimate (and ambitious) goal is to build an automated science assistant that can fully read and understand scientific content, reason from it and arrive at new insights. We are furthermore strong proponents of open science and run several projects to make science open for everyone.

By now we are an international team of 20 people scattered over 9 countries. I will also tell a bit about how I came to join this awesome bunch of people, what my role is in the research team and what an average work day looks like for me.

**Monday, 22 October 2018,
17:00 get-together with coffee and snacks!**

17:30 Alumnus Talk

Lise Meitner Hörsaal, Strudlhofgasse 4, 1st floor, Vienna

Hosted by: Frank Verstraete
